Lyme disease
prevention and treatment

Education and early detection lead to the best outcomes.

By Denise Stagg, PhD, MSN, CNE, and Jessica McCarthy, MS, MSN, APRN, FNP-BC

**SCENARIO:** When you meet your patient Tom for the first time, he reports fever, headaches, a rash on his stomach, and muscle aches. As you perform your assessment, he says, “I’m not sure what’s wrong with me. It just came on a few days ago. At least it didn’t interfere with my camping trip.”

Staying healthy through outdoor exercise and other activities includes certain risks, including Lyme disease. Exposed skin outdoors provides an opportunity for black-legged or deer ticks to attach and transmit the disease to humans. (See Lyme disease by the numbers.)

If not diagnosed and treated early, initial Lyme disease, which is caused by the bacterium *Borrelia burgdorferi*, can lead to chronic disease. Patients with chronic Lyme disease experience a substantial decline in health and quality of life, similar to patients with heart failure and type 2 diabetes, and they may require symptom management for many years. Currently, no Lyme disease vaccine is commercially available, making early recognition and treatment crucial to positive outcomes.

**Prevention and tick removal**

Preventing tick bites is the key to decreasing the occurrence of Lyme disease. (See Steps to prevention.) Nurses in endemic areas (the Northeast United States and upper Midwest) are in a prime position to offer education to patients, family, and friends. Topics to cover include preventing tick bites, inspecting for ticks, and safely removing ticks.

Locating ticks can be difficult; adult ticks are the size of a sesame seed, while nymph ticks that infect most humans are the size of a poppy seed. To transmit bacteria, the tick must be attached longer than 36 to 48 hours.

Instruct patients to remove ticks as soon as they’re found. Explain the importance of removing the head of the tick (which is typically embedded in the skin) and not just the body protrusion. (See Safe tick removal.) Patients who don’t want to remove a tick themselves should contact their healthcare provider.

**Assessment and testing**

Lyme disease is categorized into three stages, with stage one being early and stage three being late and most severe. Symptoms of early Lyme disease include fever, chills, and the bull’s-eye rash. (See Lyme signs and symptoms.) However, some cases don’t present with obvious symptoms, so your interviewing and assessment skills are key to early detection and treatment.

Ask patients about recent activities (for example, camping or hiking), travel (for example, in the Northeast or upper Midwest regions of the United States), and exposure to or interaction with animals, including household pets that have been in wooded areas or open fields. Also, ask patients if they’ve experienced headaches, rashes, joint pain, or other recent onset symptoms. Be especially alert to scenarios where the disease is most prevalent.

Lyme disease by the numbers

<table>
<thead>
<tr>
<th>Total (confirmed/probable)</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>38,069 cases of Lyme disease in the United States reported in 2015 to Centers for Disease Control and Prevention (CDC)</td>
<td>38,069</td>
</tr>
<tr>

Steps to prevention

Share these prevention tips with your patients to help reduce their risk for Lyme disease.

**Human prevention**
- Avoid wooded and brushy areas with high grass and leaf litter known to have a high concentration of ticks. (The Centers for Disease Control and Prevention has a graphic at their website showing the areas of the United States with the highest concentration of ticks that carry Lyme disease: [www.cdc.gov/ticks/geographic_distribution.html](http://www.cdc.gov/ticks/geographic_distribution.html))
- Walk in cleared trails and avoid deep woods.
- Use tick repellents that contain 20% to 30% DEET.
- Wear permethrin-treated clothing when in wooded areas.
- Cover exposed skin by wearing long pants and long-sleeve shirts.
- Inspect your body for ticks:
  - Use a mirror to see your back.
  - Pay attention to hair and armpits and behind the ears, neck, and knees.
  - Ask a partner to help with the inspection.
- Examine gear for ticks before bringing it into the house.
- Shower as soon as you come indoors.
- Tumble-dry clothes on high heat for 1 hour to kill any remaining ticks.

**Animal prevention**
- Regularly check pets for ticks.
- Remove ticks immediately.
- Consider applying tick repellant or pesticide to dogs, but first check with your veterinarian.

**In the yard**
- Keep grass trimmed.
- Clear tall grasses and brush.
- Keep patio equipment away from yard edges.
- Eliminate areas for rodents to hide, as they can carry ticks.

You also ask if he noticed any insect bites. You then begin a thorough search of Tom’s skin, looking for a bull’s-eye mark, an infected area, or an embedded tick. You see a reddened area on Tom’s abdomen and detect swollen lymph glands. You share your findings with the provider and begin serological testing as ordered.

**Education provider**

As trusted members of the healthcare profession, nurses have the...
Lyme signs and symptoms

Knowing the signs and symptoms of Lyme disease aids in early detection and treatment.

**Stage 1**
(early, localized)

Symptoms begin 1 to 4 weeks after tick bite.

- Bull’s-eye rash at location of bite (erythema migrans)
  - Occurs 70% to 80% of the time and starts at tick bite after 3 to 30 days (average 7 days)
  - Grows over days, reaching up to 12 inches or more across
  - May feel warm to the touch, but rarely itchy or painful
  - Sometimes clears as it expands, resulting in a target or bull’s-eye appearance
  - May appear on any area of the body

- Headache with or without facial rash
- Joint or muscle pain

**Stage 2**
(early dissemination)

If not found and treated, these symptoms may occur 1 to 4 months after tick bite.

- Additional bull’s-eye rashes on other areas of body
- Facial or Bell’s palsy
- Heart palpitations or irregular heartbeat (Lyme carditis)
- Inflammation of the brain and spinal cord
- Joint pain and swelling, especially knees and other large joints
- Nerve pain
- Periods of dizziness, shortness of breath
- Recurrent pain in tendons, muscles, joints, and bones
- Severe headaches and neck stiffness
- Shooting pains, numbness, or tingling in hands or feet
- Short-term memory loss

**Stage 3**
(chronic)

If not promptly or effectively treated, problems can occur months to years after tick bite.

- Arthritis, most commonly in the knee
- Dementia
- Memory loss
- Pain in joints and soft tissues
- Peripheral neuropathy

When assessing patients, engage them in conversation about the spread of the disease. If you’re a bedside or home health nurse, you’re in a unique position to share your knowledge with patients and their families. Increasing community awareness of Lyme disease is the first step to prevention.

Denise Stagg is a second-semester nursing coordina-
tor at the University of Louisiana at Lafayette. Jessica McCarthy is an instructor at University of Louisiana at Lafayette, a nurse practitioner at Minute Med Walk-In Clinic in Lafayette, and a DNP student at the Uni-
versity of Alabama at Huntsville.
