Interprofessional education
Combining skills and knowledge from different disciplines enhances patient care.

By Joanne Disch, PhD, RN, FAAN

In 2003, the Committee on Health Professions Education of the Institute of Medicine released a report recommending that “All health professionals should be educated to deliver patient-centered care as members of an interdisciplinary team, emphasizing evidence-based practice, quality improvement approaches, and informatics.” Thus, a common recommendation was directed to all health professions’ schools to ensure their graduates are competent in these five areas. Through its work in the Quality and Safety Education for Nurses (QSEN) initiative, the nursing community divided quality improvement into two competencies, resulting in a sixth area—safety.

One of the most challenging of these competencies to master is teamwork and collaboration. Historically, students in one discipline learn the content relevant to their profession but have little experience interacting with students from other disciplines. For example, in a survey asking nursing faculty from 22 schools about their students’ experiences in interprofessional (IP) learning, results showed that only 18% of students had participated in IP courses. In many cases, when students from one healthcare discipline (for example, medical school students) do attempt to practice teamwork with another healthcare discipline (for example, nursing), the approach has been to have another medical student play the role of the nurse. The same is true for many nursing schools. What we’ve routinely seen, then, are new clinicians with little authentic experience communicating with, understanding, valuing, or partnering with colleagues from other disciplines.

Interprofessional education defined
Interprofessional education (IPE), as defined by the World Health Organization, occurs “when students from two or more professions learn about, from, and with each other to enable effective communication and improve health outcomes.” The benefits to students include the following:

• They learn about each other’s scopes of responsibility and roles so that the particular expertise that each brings can be used to improve patient care.
• They can identify strengths in other team members that may complement or enrich their own practice.
• They’re more likely to ask for help or speak up to help someone else if they’ve established an interprofessional relationship.
• They develop more effective problem-solving skills as a result of working with people with differing points of view.
• Their communication skills improve, which is particularly important in high-risk situations such as handoffs or a patient crisis.
• Their patient care is safer and more personalized as a result of sharing vital information.
• They enjoy their work more because they’re part of a team that values all members for what they bring and who they are.

IPE doesn’t take the place of nursing students learning to be excellent clinicians, but since health care is a team effort, students need to learn how to work effectively with colleagues. (See Teamwork and collaboration competency.)

What’s necessary for effective IPE?
Several schools have launched ambitious programs in an attempt to provide meaningful teamwork and collaboration experiences. These programs take various forms, including having students from different professions taking courses together, collaborating on shared projects, working together in interprofessional clinics, and conducting simulation exercises. Some programs are effective, some are not.

As Deborah Powell, former dean of the School of Medicine at the University of Minnesota, once noted: “Sitting together in a class does not an interprofessional experience make.” Barnsteiner, along with nursing and medical colleagues, provides a comprehensive review of the history of IPE and suggests six criteria essential for effective IPE. (See Criteria for full engagement of interprofessional education.)

(continued on page 28)
How to get the most out of IPE

If you’re a nursing student, what can you do to get the most out of learning with students from other professions or disciplines?

Get to know the other students. Who are they, where are they from, why did they choose their particular profession? If you’re in a large class, pick out a few students and get to know them as individuals. Be ready to answer questions about why you chose nursing.

Learn about the scope of their profession or discipline. What are the common patient and family problems your fellow students focus on? What are the particular content and skill areas that are essential for them to learn? Where do they see themselves practicing?

Engage fully in joint learning experiences. Your nursing curriculum is critically important, but in today’s healthcare environment,

(continued on page 30)

### Teamwork and collaboration competency

Cronenwett and colleagues identified the following knowledge, skills, and attitudes needed to function effectively within nursing and interprofessional teams to foster open communication, mutual respect, and shared decision-making to achieve quality patient care.

#### Knowledge

- Describe own strengths, limitations, and values in functioning as a team member
- Describe scopes of practice and roles of healthcare team members
- Describe strategies for identifying and managing overlaps in team member roles and accountabilities
- Recognize contributions of other individuals and groups in helping patients and families achieve health goals

#### Skills

- Demonstrate awareness of own strengths and limitations as a team member
- Function competently within own scope of practice as a healthcare team member
- Initiate plan for self-development as a team member
- Assume role of team member or leader based on the situation
- Initiate requests for help when appropriate to situation
- Clarify roles and accountabilities under conditions of potential overlap in team member functioning
- Integrate the contributions of others who play a role in helping patients and families achieve health goals

#### Attitudes

- Acknowledge own potential to contribute to effective team functioning
- Value perspectives and expertise of all healthcare team members
- Respect the centrality of patients and families as members of any healthcare team
- Respect the unique attributes that members bring to a team, including variations in professional orientations and accountabilities

- Analyze differences in communication style preferences among patients and families, nurses, and other healthcare team members
- Describe the impact of own communication style on others
- Discuss effective strategies for communicating and resolving conflict
- Describe examples of the impact of team functioning on safety and quality of care
- Explain how authority gradients influence teamwork and patient safety

An explicit philosophy of IPE permeates the organization. The philosophy is well known, observable, and measurable. Educators from the different professions co-create the learning experiences. Students have integrated and experiential opportunities to learn collaboration and teamwork and how it relates to the delivery of safe, quality care. IPE learning experiences are embedded in the curricula and are part of the required student course load. Students demonstrate a single set of interprofessional competencies, such as those promoted by the Institute of Medicine. The organizational infrastructure fosters IPE, including support for educator time to develop IPE options, incentive systems for educators to engage in IPE, and integrated activities across schools and professions for students and educators.

To ensure an effective interprofessional education (IPE) program, Barnsteiner and colleagues developed these six criteria.

1. An explicit philosophy of IPE permeates the organization. The philosophy is well known, observable, and measurable.
2. Educators from the different professions co-create the learning experiences.
3. Students have integrated and experiential opportunities to learn collaboration and teamwork and how it relates to the delivery of safe, quality care.
4. IPE learning experiences are embedded in the curricula and are part of the required student course load.
5. Students demonstrate a single set of interprofessional competencies, such as those promoted by the Institute of Medicine.
6. The organizational infrastructure fosters IPE, including support for educator time to develop IPE options, incentive systems for educators to engage in IPE, and integrated activities across schools and professions for students and educators.

Criteria for full engagement of interprofessional education

Facilitating patient care

Healthcare complexity requires active involvement and collaboration to facilitate problem-solving, enhanced care delivery, and quality improvement. No one profession or discipline has all of the knowledge or skills. By pooling our insights and experiences, we can improve patient care and our own performance.

Joanne Disch is professor ad honorem at the University of Minnesota School of Nursing in Minneapolis.
