ROBERT, a 78-year-old patient, requests help getting to the bathroom. When the nurse, Ellen, enters the room, Robert’s lying in bed, but when she introduces herself, he lunges at her, shoves her to the wall, punches her, and bites her with a footstool. Ellen gets up from the floor and leaves the patient’s room. She tells her colleagues what happened and asks for help to get the patient to the bathroom. At the end of the shift, Ellen has a swollen calf and her shoulder aches. One of her colleagues asks if she’s submitted an incident report. Ellen responds, “It’s all in a day’s work. The patient has so many medical problems and a history of alcoholism. He didn’t intend to hurt me. What difference would it make if I filed a report?”

These kinds of nurse-patient interactions occur in healthcare settings across the United States, and nurses all too frequently minimize their seriousness. However, according to the National Institute for Occupational Safety and Health, “…the spectrum [of violence]…ranges from offensive language to homicide, and a reasonable working definition of workplace violence is
as follows: violent acts, including physical assaults and threats of assault, directed toward persons at work or on duty.” In other words, patient violence falls along a continuum, from verbal (harassing, threatening, yelling, bullying, and hostile sarcastic comments) to physical (slapping, punching, biting, throwing objects). As nurses, we must change our thinking: It’s not all in a day’s work.

This article focuses on physical violence and offers strategies you can implement to minimize the risk of being victimized.

Consequences of patient violence
In many cases, patients’ physical violence is life-changing to the nurses assaulted and those who witness it. (See Alarming statistics.) As a result, some nurses leave the profession rather than be victimized—a major problem in this era of nursing shortages.

Too frequently, nurses consider physical violence a symptom of the patient’s illness—even if they sustain injuries—they don’t submit incident reports, and their injuries aren’t treated. Ultimately, physical and psychological insults result in distraction, which contributes to a higher incidence of medication errors and negative patient outcomes. Other damaging consequences include moral distress, burnout, and job dissatisfaction, which can lead to increased turnover. However, when organizations encourage nurses to report violence and provide education about de-escalation and prevention, they’re able to alleviate stress.

Workplace violence prevention
Therapeutic communication and assessment of a patient’s increased agitation are among the early clinical interventions you can use to prevent workplace violence. Use what you were taught in nursing school to recognize behavioral

Alarming statistics
The statistics around patient violence against nurses are alarming.

67% of all nonfatal workplace violence injuries occur in healthcare, but healthcare represents only 11.5% of the U.S. workforce.

Emergency department (ED) and psychiatric nurses are at highest risk for patient violence.

Hitting, kicking, beating, and shoving incidents are most reported.

25% of psychiatric nurses experience disabling injuries from patient assaults.

At one regional medical center, 70% of 125 ED nurses were physically assaulted in 2014.

Communication strategies
Effective communication is the first line of defense against patient violence. These tips can help:

- To build trust, establish rapport and set the tone as you respond to patients.
- Meet patients’ expectations by listening, validating their feelings, and responding to their needs in a timely manner.
- Show your patients respect by introducing yourself by name and addressing them formally (Mr., Ms., Mrs.) unless they state another preference.
- Strive for communication that gives the patient control, when possible. Example: “Which of your home morning routines would you like to follow while you’re in the hospital? Would you like to wash your hands and face first, eat your breakfast, and then brush your teeth?”
- Control your emotions and maintain neutral, nonthreatening body language.
- Strive for communication that gives the patient control, when possible. Example: “Which of your home morning routines would you like to follow while you’re in the hospital? Would you like to wash your hands and face first, eat your breakfast, and then brush your teeth?”
- Only state consequences if you plan to follow through.
- Listen to what patients say or ask, and then validate their requests.
- Discuss patients’ major concerns and how they can be addressed to their satisfaction.

Despite these strategies, patients may still become upset. If that occurs, try these strategies to de-escalate the situation before it turns violent.

- **Nonverbal communication.** “I see from your facial expression that you may have something you want to say to me. It’s okay to speak directly to me”
- **Challenging verbal exchange.** “My goal is to be helpful to you. If you have questions or see things differently, I’m willing to talk to you more so that we can understand each other better, even if we can’t agree with one another.”
- **Perceptions of an incident or situation.** “We haven’t discussed all aspects of this situation. Would you like to talk about your perceptions?”
changes, such as anxiety, confusion, agitation, and escalation of verbal and nonverbal signs. Individually or together, these behaviors require thoughtful responses. Your calm, supportive, and responsive communication can de-escalate patients who are known to be potentially violent or those who are annoyed, angry, belligerent, demeaning, or are beginning to threaten staff. (See Communication strategies.)

Other strategies to prevent workplace violence include applying trauma-informed care, assessing for environmental risks, and recognizing patient triggers.

Trauma-informed care
Trauma-informed care considers the effects of past traumas patients experienced and encourages strategies that promote healing.

The Substance Abuse and Mental Health Services Administration says that a trauma-informed organization:
- realizes patient trauma experiences are widespread
- recognizes trauma signs and symptoms
- responds by integrating knowledge and clinical competencies about patients’ trauma
- resists retraumatization by being sensitive to interventions that may exacerbate staff-patient interactions.

This approach comprises six principles: safety; trustworthiness and transparency; peer support; collaboration and mutuality; empowerment, voice, and choice; and cultural, historical, and gender issues. Applying these principles will enhance your competencies so that you can verbally intervene to avoid conflict and minimize patient retraumatization. For more about trauma-informed care, visit samhsa.gov/nctic/trauma-interventions.

Environmental risks
To ensure a safe environment, identify objects in patient rooms and nursing units that might be used to injure someone. Chairs, footstools, I.V. poles, housekeeping supplies, and glass from lights or mirrors can all be used by patients to hurt themselves or others. Remove these objects from all areas where violent patients may have access to them.

Patient triggers
Recognizing and understanding patient triggers may help you de-escalate volatile interactions and prevent physical violence.

Common triggers
- Expectations aren’t met
- Perceived loss of independence or control
- Upsetting diagnosis, prognosis, or disposition
- History of abuse that causes an event or interaction to retraumatize a patient

Predisposing factors
- Alcohol and substance withdrawal
- Psychiatric diagnoses
- Trauma
- Stressors (financial, relational, situational)
- History of verbal or physical violence

Influence organizational safety
You and your nurse colleagues are well positioned to influence your organization’s culture and advocate for a safe environment for staff and patients. Share these best practices with your organization to build a comprehensive safety infrastructure.

- Establish incident-reporting systems to capture all violent incidents.
- Create interprofessional workplace violence steering committees.
- Develop organizational policies and procedures related to safety and workplace violence, as well as human resources support.
- Provide workplace violence-prevention and safety education using evidence-based curriculum.
- Design administrative, director, and manager guidelines and responsibilities regarding communication and staff support for victims of patient violence and those who witness it.
- Use rapid response teams (including police, security, and pro-

- **Centers for Disease Control and Prevention (cdc.gov/niosh/topics/violence/training_nurses.html):** This online course (“Workplace violence prevention for nurses”) is designed to help nurses better understand workplace violence and how to prevent it.

- **Emergency Nurses Association (ENA) toolkit (goo.gl/oJuYsb):** This toolkit offers a five-step plan for creating a violence-prevention program.

- **Share human resources contacts.**

- **Post accessible resources on the organization’s intranet.**

- **Create scorecards to benchmark quality indicators and outcomes.**

- **Delineate violence risk indicators to proactively identify patients with these behaviors.**

Advocate for the workplace you deserve

Physically violent patients create a workplace that’s not conducive to compassionate care, creating chaos and distractions. Nurses must advocate for a culture of safety by encouraging their organization to establish violence-prevention policies and to provide support when an incident occurs.

You can access violence-prevention resources through the American Nurses Association, Emergency Nurses Association, Centers for Disease Control and Prevention, and the National Institute for Occupational Safety and Health. Most of these organizations have interactive online workplace violence-prevention modules. (See Resources.) When you advocate for safe work environments, you protect yourself and can provide the care your patients deserve.

The authors work at University Hospitals of Cleveland in Ohio. Lori Locke is the director of psychiatry service line and nursing practice. Gail Bromley is the codirector of nursing research and educator. Karen A. Federspiel is a clinical nurse specialist III.

Hunger is a health issue.

People experiencing food insecurity are more likely to suffer from chronic conditions such as diabetes, heart disease and depression. In just 60 minutes, health care providers and community-based partners can learn how to screen patients age 50 and older for food insecurity and connect them to key nutrition resources.

Check out the course today at seniorhealthandhunger.org

This Enduring Material activity, Screen and Intervene: Addressing Food Insecurity Among Older Adults, has been reviewed and is acceptable for up to 1.00 Elective credit(s) by the American Academy of Family Physicians. AAFP certification begins 10/28/2017. Term of approval is for one year from this date. Physicians should claim only the credit commensurate with the extent of their participation in the activity.
